NEMATODE PESTS OF MUSHROOM: BIOLOGY AND MANAGEMENT
Kirti Sharma and Archana U. Singh

Received June 12, 2009 and Accepted November 17, 2009

ABSTRACT: The unhygienic conditions of mushroom cultivation provide a congenial atmosphere for many pests and diseases. Of these, the most dangerous are nematodes which, once enter the crop bed, cannot be eradicated without complete elimination of the crop. Their presence in the bed leads to very poor yields of total crop failures.

Key Words: Nematode pest, Mushroom, Biology and Management.
